Discharge Policy of 2019-nCoV case

Clinical samples of any suspect case* of 2019-nCoV will be sent for laboratory confirmation to designated laboratories. The case will be kept in isolation at health facility till the time of receipt of laboratory results and given symptomatic treatment as per the guidelines. If the laboratory results for 2019-nCoV are negative, the discharge of such patients will be governed by his provisional/confirmed diagnosis and is up to the treating physician to take a decision guided by clinical condition of the case. The case shall be monitored for 14 days from their date of arrival to India/last exposure whichever is latest. In case the laboratory results are positive for 2019-nCoV, the case shall be managed as per the confirmed case management protocol. The case shall be discharged only after evidence of chest radiographic clearance and viral clearance in respiratory samples after two specimens test negative for 2019-nCoV within a period of 24 hours.

Suspect Case

Send clinical samples for testing of 2019-nCoV

Sample result negative

The discharge will be guided by clinical condition of the case. He/she shall be monitored for 14 days from their date of arrival to India/last exposure whichever is latest

Sample result positive

Confirmed cases management protocol

Discharge after clinical clearance and chest radiograph cleared and two specimens turn negative.

- **First Sample:** 14 days after collection of first sample positive for SARS-CoV2
- **Second Sample:** At least 24 hours after the negative sample.

Case Classification*

**Suspect Case:**
- A patient with acute respiratory illness {fever and at least one sign/symptom of respiratory disease (e.g., cough, shortness of breath)}, **AND** a history of travel to or residence in a country/area or territory reporting local transmission (See NCDC website for updated list) of COVID-19 disease during the 14 days prior to symptom onset;
  
  **OR**

- A patient/Health care worker with any acute respiratory illness **AND** having been in contact with a confirmed COVID-19 case in the last 14 days prior to onset of symptoms;
  
  **OR**

- A patient with severe acute respiratory infection {fever and at least one sign/symptom of respiratory disease (e.g., cough, shortness breath)} **AND** requiring hospitalization **AND** with no other etiology that fully explains the clinical presentation;
  
  **OR**

- A case for whom testing for COVID-19 is inconclusive.
**Laboratory Confirmed case:**
A person with laboratory confirmation of COVID-19 infection, irrespective of clinical signs and symptoms.

**Updated definition of contact:** A contact is a person that is involved in any of the following:
- Providing direct care without proper personal protective equipment (PPE) for COVID-19 patients
- Staying in the same close environment of a COVID-19 patient (including workplace, classroom, household, gatherings).
- Traveling together in close proximity (1 m) with a symptomatic person who later tested positive for COVID-19.

**High Risk Contact:**
- Touched body fluids of the patient (Respiratory tract secretions, blood, vomit, saliva, urine, faeces)
- Had direct physical contact with the body of the patient including physical examination without PPE.
- Touched or cleaned the linens, clothes, or dishes of the patient.
- Lives in the same household as the patient.
- Anyone in close proximity (within 3 ft) of the confirmed case without precautions.
- Passenger in close proximity (within 3 ft) of a conveyance with a symptomatic person who later tested positive for COVID-19 for more than 6 hours.

**Low Risk Contact:**
- Shared the same space (Same class for school/worked in same room/similar and not having a high risk exposure to confirmed or suspect case of COVID-19).
- Travelled in same environment (bus/train/flight/any mode of transit) but not having a high-risk exposure.
